Abstract

We report the first record of *Hippeastrum puniceum* (Lam.) Kuntze in Maranhão and expand the known geographical distributions of *Alophia drummondii* (Graham) R. Foster and *Rapatea paludosa* Aubl. in that state. *Alophia drummondii* and *Hippeastrum puniceum* were collected in Cerrado fragments in the municipality of Caxias and *Rapatea paludosa* in a swamp-forest gallery in a transition area between the Amazon region and the Cerrado in the municipality of Morros. Ecological and taxonomic information is included, as well as morphological descriptions, identification keys to species, distribution maps, photographs, and preliminary conservation statuses of these species in Brazil.

Introduction

Brazil stands out by having the most species-rich flora on the planet, with over 35,000 species, of which 18,790 are endemic. However, several regions and states, such as

Maranhão, are still undersampled (Flora do Brasil 2020 2022). Taxonomic and floristic studies provide the essential, important information on the origin and geographic

distribution of plant species (Rossatto et al. 2008).

The state of Maranhão is located at the convergence between the Amazon, Cerrado, and Caatinga domains and, therefore, has varied plant formations and a diverse flora (Muniz 2006; Dias et al. 2009). However, recently published new records (Ferreira et al. 2017, 2018, 2019a, 2019b; Guarçoni et al. 2018; Rodrigues et al. 2019; Guarçoni et al. 2020a, 2020b; Salazar-Ferreira et al. 2020; Silva et al. 2020; Silva Junior et al. 2020a; Almeida et al. 2021; Oliveira et al. 2021; Ferreira et al. 2022) and new species (Scatigna et al. 2019; Guarçoni et al. 2020b; Santos et al. 2020) suggest that the flora of Maranhão is still poorly known.

We provide the first record of *Hippeastrum puniceum* (Lam.) Kuntze and expand the known geographic distributions of *Alophia drummondii* (Graham) R. Foster (Iridaceae) and *Rapatea paludosa* Aubl. (Rapateaceae) in the state of Maranhão, northeastern Brazil (Fig. 1). We present identification keys to species of *Hippeastrum* Herb., *Alophia* Herb., and *Rapatea* Aubl. in Maranhão, morphological descriptions, photographs, and georeferenced new records of the three species. We also provide preliminary conservation statuses of these species in Brazil.

Methods

Located in the Northeast Region of Brazil, the state of Maranhão has 217 municipalities and occupies an area

of 331,983 km². The vegetation has ecotonal characteristics due to its position between the Amazon (Northern Region of Brazil), Cerrado (Midwest Region) and Caatinga (Northeast Region) domains (Muniz 2006). The climate is of the “Am” type according to Köppen climate classification system (Alvares et al. 2013), with an average annual temperature of up to 27 °C and an average annual rainfall of 800–2,800 mm (Martins and Oliveira 2011). There is a dry season (June to December), and a rainy season from January and March (IMESC 2008).

The specimens collected were herborized according to the botanical treatment proposed by Fidalgo and Bononi (1989) and the botanical classification system used was the APG IV (2016). The species were identified with the specialist literature (Dutilh 2005; Alves-Araújo et al. 2009; Candido et al. 2014) and by comparison with material already identified and available online in herbaria (CEN, HUTO, MO, NY, P, RB, UB, UNB; acronyms according to Thiers 2020). The geographic distribution of the species has been reported by Govaerts (2021) and is available online in SpeciesLink (2021), Tropicos (2021), and Flora do Brasil 2020 (2022) databases. The exsiccates were deposited in the Rosa Mochel herbarium (SLUI) of the Universidade Estadual do Maranhão, São Luís, Maranhão.

The maps were produced with QGIS v. 2.18.12 using the SIRGAS 2000 system. The software Adobe

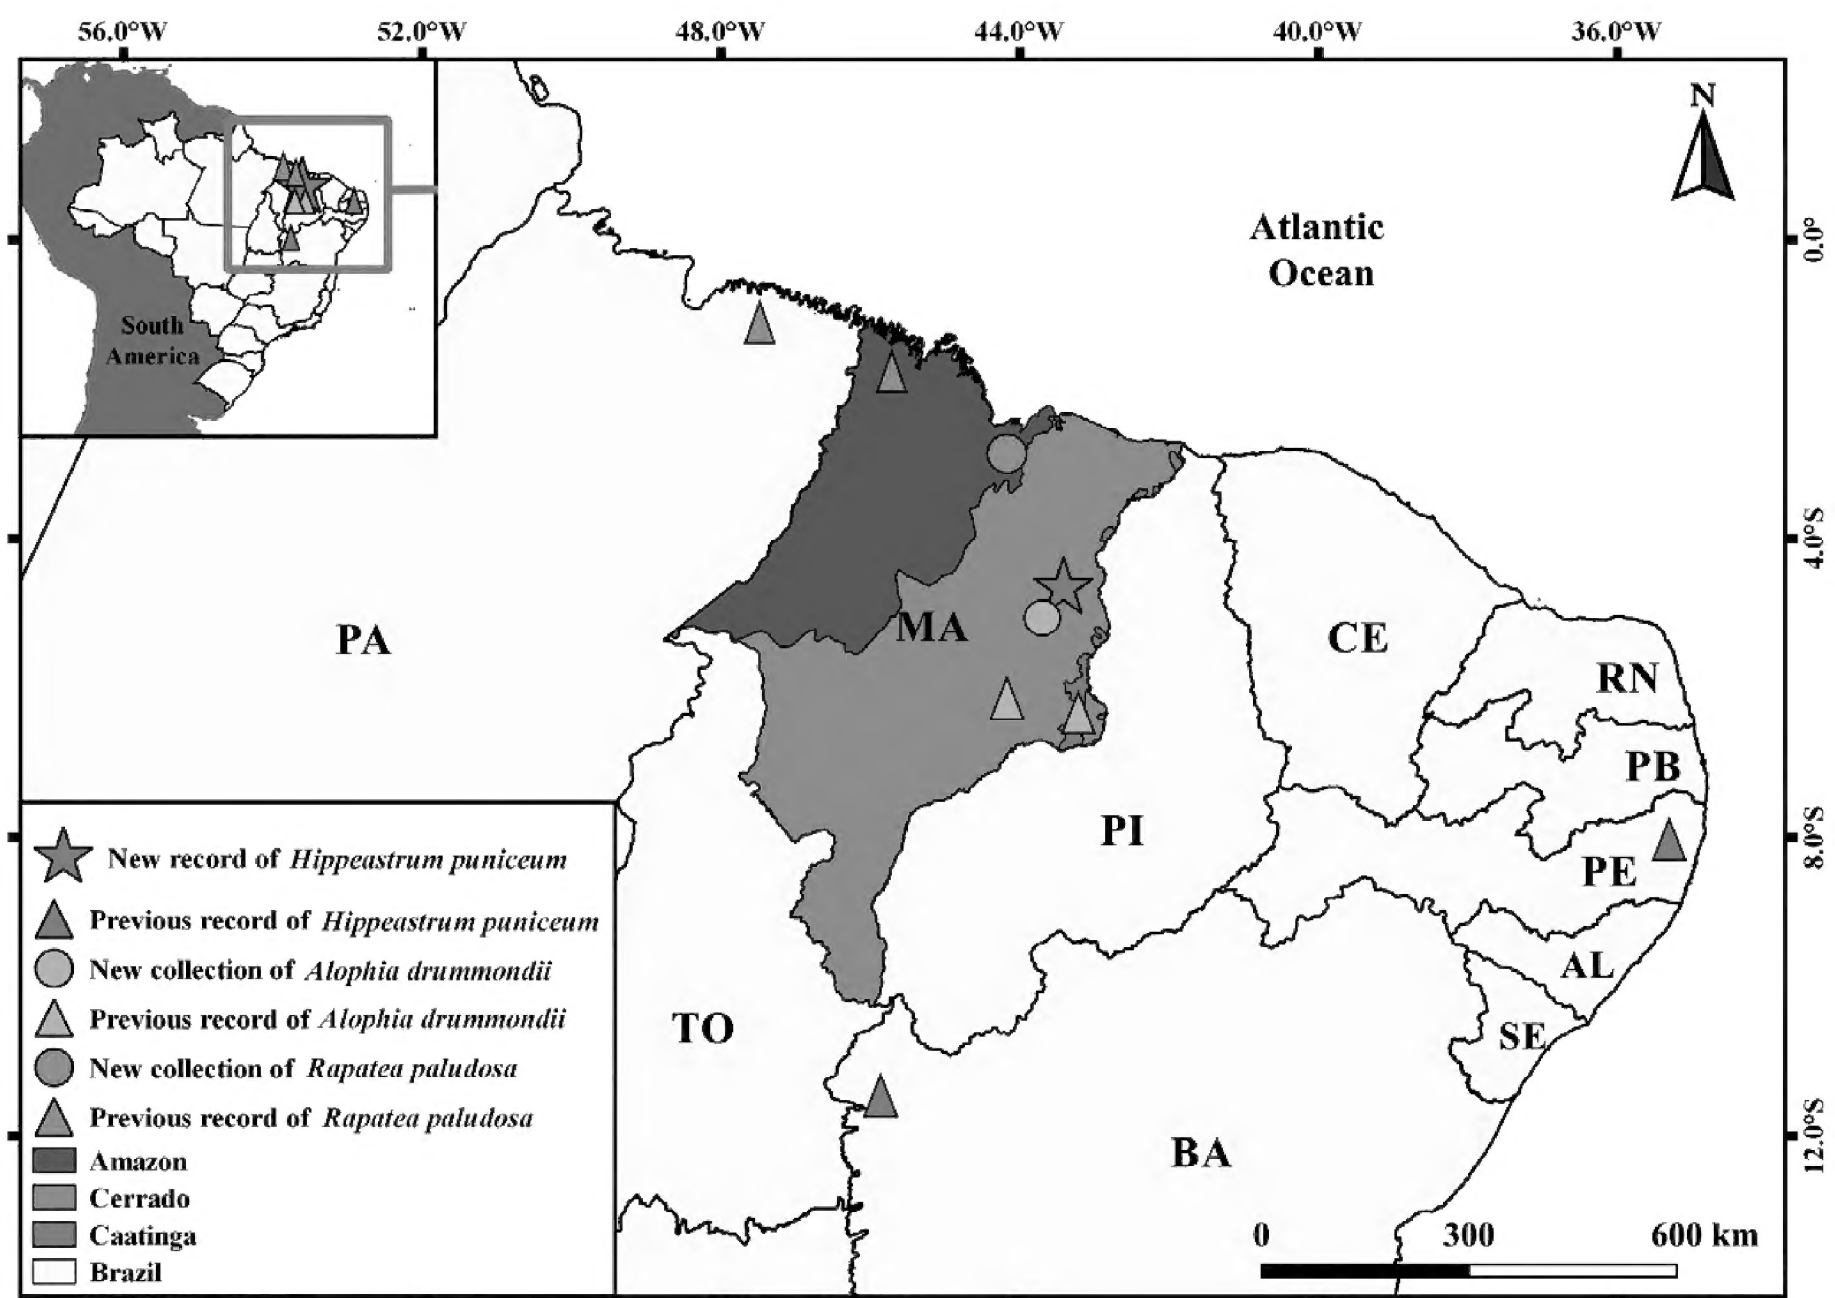

Figure 1. Collection sites and close by previous records *Hippeastrum puniceum* (Lam.) Kuntze, *Alophia drummondii* (Graham) R. Foster, and *Rapatea paludosa* Aubl. in Maranhão, Brazil.

Photoshop CS5 v. 12.0 was used to assemble and edit the figures.

For determining the preliminary conservation statuses of the species, the extent of occurrence (EOO) and the area of occupancy (AOO) of each species were calculated using the Geospatial Conservation Assessment Tool (GeoCAT; <http://geocat.kew.org>). AOO was based on a 2 × 2-km cell (Bachman et al. 2011). For the evaluation, data from our collected specimens and 248 occurrences (with coordinates) obtained from SpeciesLink (2021) were used. We assessed the conservation status of each species using the criteria of the International Union for Conservation of Nature (IUCN 2012).

Figure 2. *Hippeastrum puniceum* (Lam.) Kuntze. **A.** Inflorescence and leaves. **B.** Dissected tepals. **C.** Internal view of the flower. **D.** Flower with the perigonium removed, showing the stamens and pistil. **E.** Fimbriae at the base of the tepals.

Identification. Perennial herb, 64–77 cm height during flowering. **Bulb** light brown, subterranean, orbicular, $3.4\text{--}4.5 \times 5.3\text{--}7.1$ cm; bulb neck $3.0\text{--}4.9$ cm long. **Leaves** annual, green, ensiform, erect, with canalicular base, margin entire, apex acute, $32.1\text{--}53.2$ cm \times $1.7\text{--}3.1$ cm. **Inflorescence** 2 or 3 flora, umbelliform, cylindrical, hollow, $64.1\text{--}71.2 \times 1.6\text{--}1.9$ cm; bracts green, spatheaceous, free, with acute apex, $4.1\text{--}7.1$ cm \times $0.7\text{--}1.0$ cm. **Flowers** orange, reflexed, pedicels; pedicel green, cylindrical, $3.4\text{--}6.1$ cm long; Perigone declined, campanulate, $11.5\text{--}13.7$ cm long; hypanthium tube orange, $2.1\text{--}3.1$ cm long; Tepals 6, orange to reddish, reflexed internally yellowish and forming a ring around the middle region of the tepals; external superior tepal $12.4\text{--}13.5 \times 3.7\text{--}4.5$ cm, external lateral tepal $12.6\text{--}13.2 \times 2.9\text{--}4.0$ cm, lower inner tepal $12.4\text{--}13.1 \times 2.1\text{--}2.4$ cm, inner lateral tepal $12.1\text{--}13.4 \times 2.8\text{--}4.2$ cm; stamens tridynamous, fillets green from the base to the median region and red in the apical portion, $5.6\text{--}10.2$ cm long, anthers yellow, $5\text{--}9.1$ cm long; lower ovary, trilobular, $8\text{--}10.1$ mm long; stigma capitate, 3-lobed, red; stylet green from the base to the median region and red in the apical portion, $10\text{--}10.5$ cm long; **Fruit** not seen.

Identification key to *Hippeastrum* species in Maranhão

- 1 Inflorescence 2 flora, greenish flowers, presence of a greenish ring in the inner medial region of the tepals, homodynamic stamens, anthers cream *Hippeastrum elegans* (Spreng.) H.E. Moore
- 1' Inflorescence >2 flora, flowers red or orange, ring in the inner medial region of the tepals present or absent, isodynamic stamens or tridynamous, anthers cream with vinaceous or yellow bands 2
- 2 Inflorescence 2–7 flora, flowers red, ring in the inner medial region of the tepals absent, stamens isodynamic, anthers cream with vinaceous bands *Hippeastrum stylosum* Herb.
- 2' Inflorescence 2 or 3 flora, flowers orange, presence of yellowish ring in the inner medial region of the tepals, stamens tridynamous, anthers yellow *Hippeastrum puniceum* (Lam.) Kuntze.

Alophia drummondii (Graham) R.C. Foster

Figure 3A–C

New records. Brazil – **Maranhão** • Municipality of Caxias, Baixão do Albuquerque, 2nd district of Caxias; $04^{\circ}40'02''\text{S}$, $043^{\circ}24'18''\text{W}$; 2.XII.2018; M.S. de Oliveira & A.W.C. Ferreira 88 leg. (SLUI 5953) • Municipality of Caxias, Área Municipal de Proteção Ambiental de Inhamum; $04^{\circ}53'26''\text{S}$, $043^{\circ}25'44''\text{W}$; 28.IV.2018; M.S. Oliveira s/n leg. (SLUI 5954).

Identification. Herbs, 55–65 cm high. **Bulbs** ca. $1.3\text{--}4.2 \times 0.8\text{--}2.2$ cm. **Leaves** 1–3 per plant. $22\text{--}45 \times 0.2\text{--}1.2$ cm. linear to narrow-lanceolate. membranaceous **Scape** ca. 41 cm long. Bracts, 1–3, 3-branched, linear; first bract $8\text{--}46 \times 0.4\text{--}1.5$ cm, other bracts ca. $2.7\text{--}5.5 \times 0.3\text{--}0.5$ cm, separated by internodes. **Ripidial**–3, lax; peduncle

$1.7\text{--}10.2$ cm long; spaths $1.3\text{--}6 \times 0.4\text{--}1.3$ cm. **Flowers** purple; outer tepals obovate, $1.3\text{--}2.4 \times 0.8\text{--}1.6$ cm, with rounded or truncate apex and median-basal region yellowish with brownish-brown grooves; internal tepals $1.2\text{--}1.6 \times 0.5\text{--}0.7$ cm, involuted, with rounded apex and yellowish base; filaments purple, ca. 0.4 cm long, attached to the base; anthers purple, $0.4\text{--}0.6$ cm long; ovary 4.5 cm long; styles purple, ca. 0.7 cm long; stigmas bifid. **Fruit** capsule $4\text{--}3.5 \times 0.7\text{--}1.2$ cm, oblong; seeds ca. 0.3×0.2 cm.

Identification key to *Alophia* species in Brazil

- 1 Leaves teret or subteret; long terminal bract above ripidia *Alophia medusae* (Baker) Goldblatt.
- 1' Leaves of ensiform or linear limbus, plicated; terminal bract above ripidia absent *Alophia drummondii* (Graham) R. Foster.

Rapatea paludosa Aubl.

Figure 3D, E

New record. Brazil. **Maranhão** • Morros, Rio Pacas; $02^{\circ}53'43''\text{S}$, $044^{\circ}04'9''\text{W}$; 28.I.2021; A.W.C. Ferreira 1557 leg. (SLUI 5955).

Identification. Herb 70–100 cm long. **Leaves** discolored, symmetrical, with mucilage at base; petiole absent, with sheaths $16.0\text{--}25.5$ cm long \times $1.2\text{--}2.4$ cm wide; leaf blade $84\text{--}137$ cm long \times $6\text{--}9.5$ cm wide, wide-lanceolate, glabrous, surfaces with inconspicuous roughness, prominent central vein on both sides, prominent secondary veins on the abaxial surface, apex acute, base attenuate.

Inflorescence capituliform, terminal, axis flattened to convex, spikelets ca. 50–70; scape $15\text{--}40 \times 0.6\text{--}1.9$ cm, flattened, sparsely pubescent, sulcate; bracts two, spathiform, at apex of scape, $10.5\text{--}23 \times 4.7\text{--}6.5$ cm, lanceolate to wide-lanceolate, distinct from the central axis of the inflorescence, erect, persistent, apex acute, base cordate or subcordate; spikelet pedicellate, with a series of terminal bracteoles and a single flower; pedicel $1.0\text{--}1.8$ cm long, sparsely pubescent; bracteoles 11–13 per spikelet, heterogeneous; proximal bracteoles $0.64\text{--}1.1$ cm long; distal bracteoles $1.2\text{--}1.45$ cm long, oblong to elliptic-lanceolate, papyraceous, apex brown and long-acuminate or aristate. **Flower** pedicellate; pedicels $1.1\text{--}2.3$ cm long; **sepals** $0.75\text{--}1.5$ cm long, briefly connate at the base forming a hyaline-membranous tube, lanceolate lobes, navicular, papyraceous; **petals** $1.4\text{--}1.6 \times 0.4$ cm, yellow, connate forming a hyaline-membranous tube; trilobed, lobes obovate; filaments ca. 1.3 cm long, tomentose; stamens 6; **anthers** $0.4\text{--}0.75$ cm long, yellow, lanceolate, 4-locular, sulcate, with apical appendages to 0.15 cm long, brown; **ovaries** $0.3\text{--}0.5$ cm long, rounded, apocarpous, carpels 3, unilocular; styles ca. 1.2 mm long, central, apically recurved, bases whitish; stigma ca. 0.5 mm long, simple, swollen, brown. **Capsules** ca. $0.5\text{--}0.65 \times 0.28\text{--}0.35$ cm, ovate, obovate to ellipsoid, yellowish. **Seed** $0.27\text{--}0.33$ mm long, ellipsoid to oblong, brown when ripe, longitudinally striate.

Figure 3. A–C. *Alophia drummondii*: (A) inflorescence and flower; (B) fruits; (C) flower in front view. **D, E.** *Rapatea paludosa*: (D) flower in front view; (E) inflorescence in lateral view.

Identification key to *Rapatea* species in Maranhão

- 1 Leaf blades lanceolate and base asymmetrca ttenuated; inflorescence capituliform *Rapatea paludosa* Aubl.
- 1' Leaf blades narrowly lanceolate and base symmetrical attenuated; inflorescence glomerulate
..... *Rapatea pycnocephala* Seub.

Discussion

Our findings of *Hippeastrum puniceum* (Fig. 2) increase the known geographic distribution of this species. The nearest previously known occurrences nearest collection points (Reflora 2021; SpeciesLink 2021) are approximately 802 km south (Formosa do Rio Preto, Bahia, Brazil), 1,079 km west (Serra do Cachimbo, Pará, Brazil), and 996 km east (São Lourenço da Mata, Pernambuco, Brazil) from where we collected this species. Additionally, our new findings are the first of this species in Maranhão, expanding the geographic distribution of the species and the genus *Hippeastrum* in the Northeast Region of Brazil. This demonstrates the importance of more collection effort for the documentation of the flora of Maranhão.

Hippeastrum puniceum is widely distributed in the Neotropics (Govaerts et al. 2021) and occurs in several Brazilian states. In Brazil, it is distributed in all phytogeographic domains Amazon, Atlantic Forest, Caatinga, Cerrado, Pampa, and Pantanal and confirmed from the states of Amazonas, Amapá, Bahia, Espírito Santo, Goiás, Mato Grosso do Sul, Mato Grosso, Minas Gerais, Pará, Pernambuco, Paraná, Rio de Janeiro, Rio Grande do Sul, São Paulo, and Santa Catarina, as well as the Distrito Federal according to BFG (2015, 2018), Dutilh et al. (2020), and Flora do Brasil 2020 (2022).

Hippeastrum puniceum occurs in various vegetation formations and environments, such as wet lowlands, plateaus, fields, Cerrado, abandoned cultivation areas, sandbanks, and rocks (Dutilh 2005; Candido et al. 2014). We found this species at the beginning of the rainy season (November and December) on sandy soil in a Cerrado fragment. There was a small population of approximately six flowering individuals, with the presence of leaves and flower buds at different stages of development, which open consecutively.

Using the 249 occurrences of *H. puniceum* in Brazil (SpeciesLink 2021), including our new record, the species has an EOO of 7,154,200 km² and an AOO of

684 km² (Fig. 4). Therefore, according to IUCN criteria (IUCN 2012), *H. puniceum* is preliminarily assessed as Least Concern.

In Brazil, *H. puniceum* is popularly known as açucena, açucena-laranja, amarilis, cebola-berrante, lírio, lírio-vermelho (Neto and Amaral 2010; Candido et al. 2014; Ribeiro and Boscolo 2018). This species exhibits seasonal leaf loss. It is easy to grow and has showy flowers that are variable in color and so it is occasionally cultivated in domestic gardens in several Brazilian states (Dutilh 2005; Alves-Araújo et al. 2009; Candido et al. 2014). In some countries, it is cultivated for medicinal purposes (Hanelt 2001). In Brazil, only bulbs have been reported to be used in traditional medicine, even though the safety and efficacy of their use have not yet been scientifically proven (Lorenzi and Matos 2008).

We expand the geographic distribution of *A. drummondii* (Fig. 3A–C) north by 194 km from Mirador State Park, Geraldina base, Maranhão and 209 km from Barão de Grajaú, Maranhão (SpeciesLink 2021; Flora do Brasil 2020 2022).

Alophia drummondii occurs from the United States of America to South America (Goldblatt and Manning 2008). In Brazil it is known only from Alagoas, Ceará, Paraíba, Pernambuco, Maranhão, Piauí, Rio Grande do Norte, and Bahia, in the northeastern region, where it occurs in areas of Cerrado and Caatinga vegetation (Oliveira et al. 2016; Melo et al. 2018; Eggers and Chauveau 2020; Flora do Brasil 2020 2022). The

conservation status of this species has not yet been evaluated (Eggers and Chauveau 2020; IUCN 2021).

In Maranhão, *A. drummondii* is known to occur together with *A. medusae* (Baker) Goldblatt, which is distinguished by the plicated, ensiform or linear leaf blades and the absence of a terminal bract projecting above the ripidia. Integrative taxonomy studies, including samples from throughout the entire distribution of the species, are needed to better understand this taxon (Eggers and Chauveau 2020).

We expand the geographic distribution of *Rapatea paludosa* (Fig. 3D, E) east by 221 km from Fazenda Sete Irmão, Cândido Mendes, Maranhão, and 447 km from Maracanã, Pará (SpeciesLink 2021; Flora do Brasil 2022).

Rapatea paludosa occurs in Brazil, French Guiana, Guyana, Panama, Suriname, and Venezuela (Tropicos 2020). In Brazil, specimens have been reported in the Amazon Forest and Atlantic Forest of Acre, Amapá, Amazonas, Pará, Rondônia, Tocantins, Mato Grosso, Bahia (Praia et al. 2016; Flora do Brasil 2022), and Maranhão (Ferreira et al. 2019c). The conservation status of this species has not yet been evaluated (IUCN 2021).

According to Ferreira et al. (2019c), in Maranhão (Sete Irmãos Farm, Cândido Mendes), *R. paludosa* occurs in small populations in fragmented areas that are constantly altered by human activities. The Maranhense Amazon is the most threatened in Maranhão and about 76% of its land area has been deforested and the remaining 24% has some level of disturbance (Celentano et al.

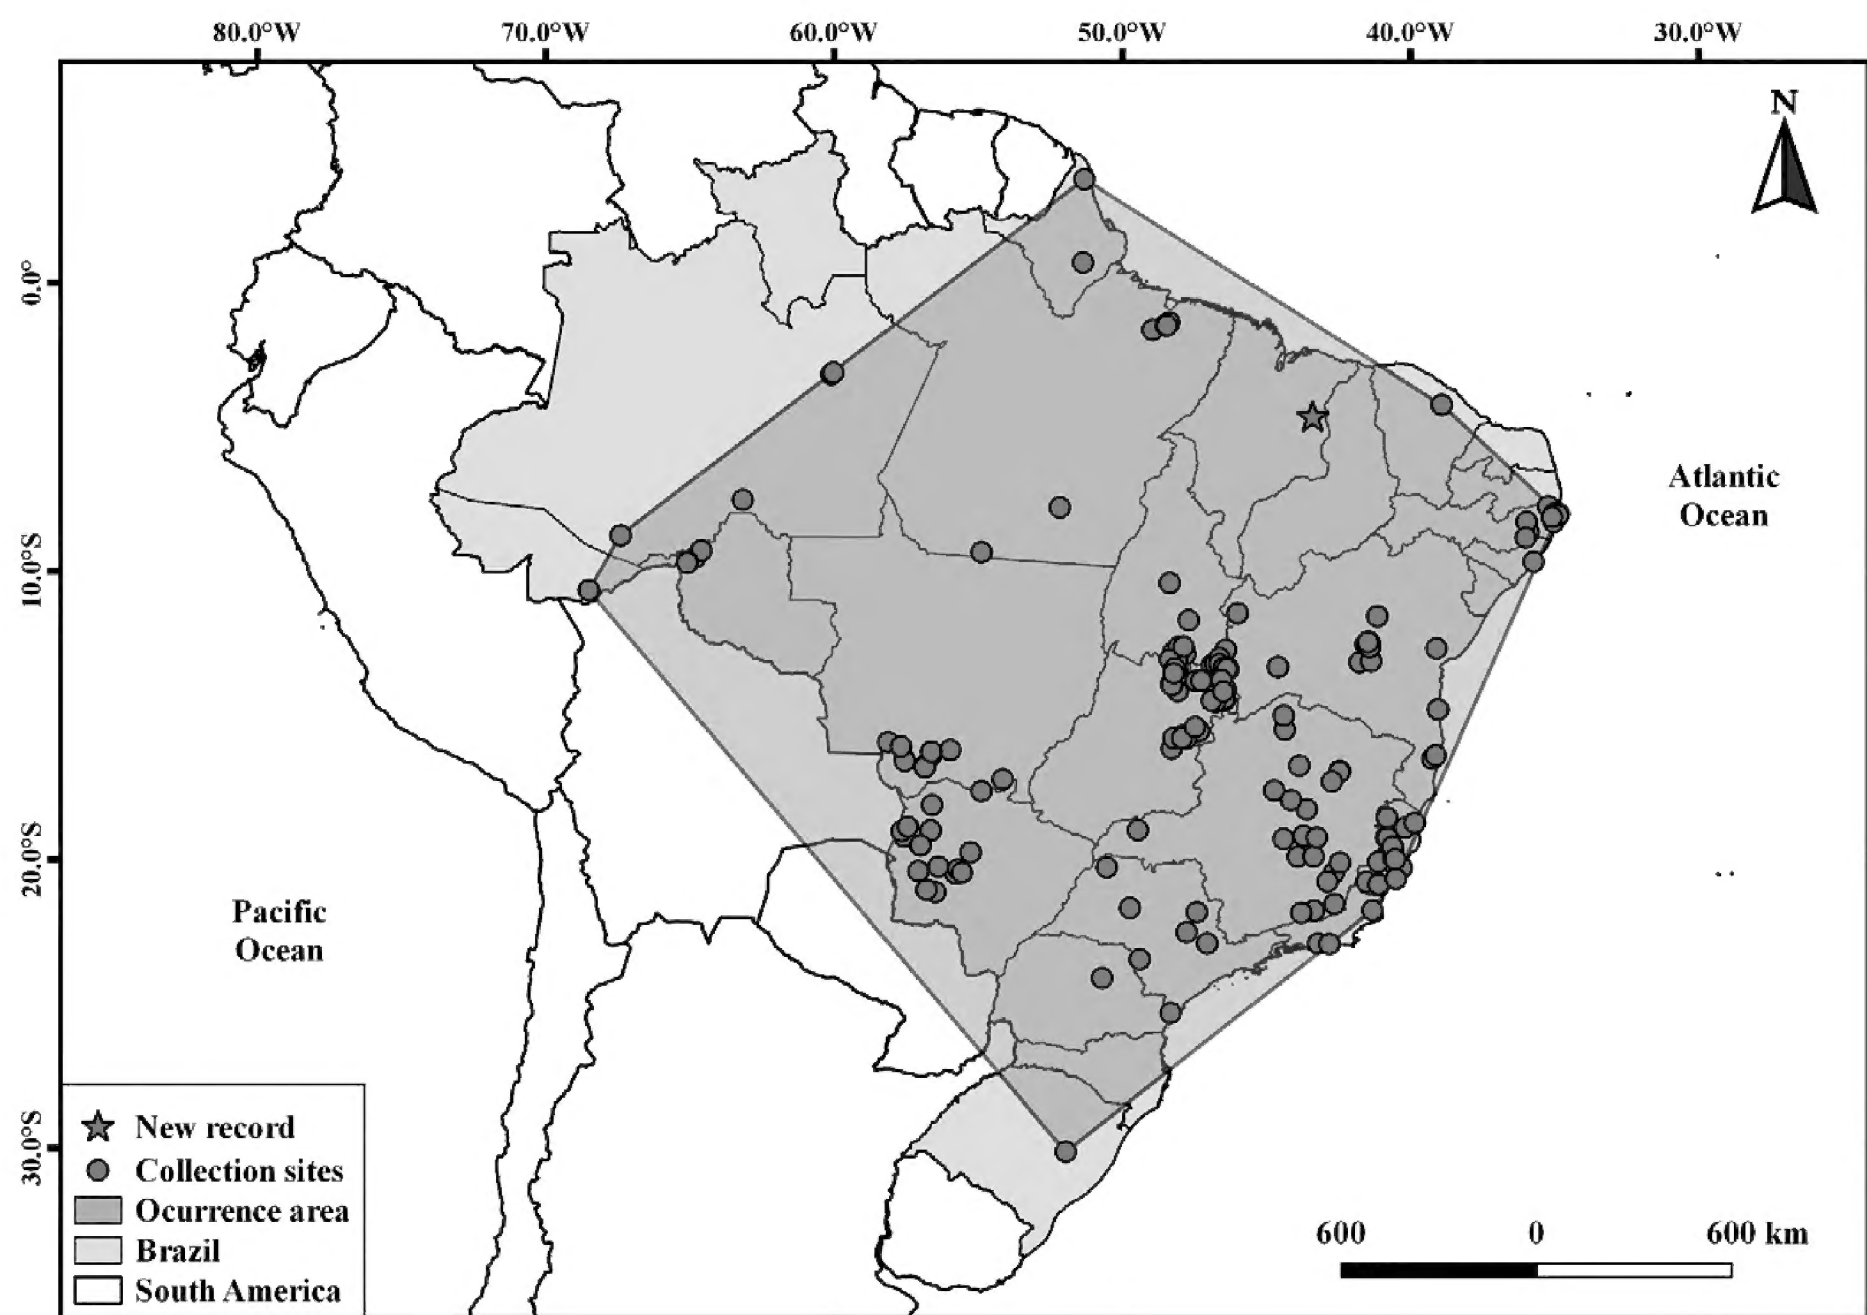

Figure 4. Area of occurrence of *Hippeastrum puniceum* in Brazil.

2017, 2018; Silva Junior et al. 2020b). Therefore, *R. paludosa* has likely been affected by deforestation and may be threatened, at least in Maranhão. The population that we found in Morros, which is within in a transitional area with the Cerrado Maranhense, is larger than the Cândido Mendes population observed by Ferreira et al. (2019c). However, the Morros population also is under threat from deforestation and trampling caused by pigs and chickens from nearby rural properties.

Acknowledgements

We thank Raimundo Nonato Ferreira de Oliveira Filho and family for authorizing entry into his property and conducting field expeditions. FAPESPA/MPEG/FADESP for granting the scholarship to one of us (M.S. Oliveira). A.W.C. Ferreira thanks FAPEMA (Edital Universal 01312-2019).
